1. Introduction to Project

In today's fast-growing digital environment, small retail businesses are also shifting towards digital solutions to improve efficiency and accuracy. Traditional vegetable shops often rely on manual methods for maintaining stock, billing, and customer records, which can result in calculation errors, data loss, and time-consuming processes.

The "Fresh Basket" project is designed to overcome these challenges by providing a web-based system that automates daily shop operations. It helps shop owners manage inventory, generate bills, and maintain records efficiently.

The system includes two main modules: Admin and User. The admin module allows management of products, stock, and billing, while the user module enables customers to browse and order products easily.

By implementing this system, the dependency on manual work is reduced, and overall productivity is improved.

2. Objective of Project:

The main objective of the Fresh Basket project is to develop a web-based application that simplifies and automates the operations of a vegetable shop. The key objectives are as follows:

- To automate stock management and product handling.
- To simplify billing using QR/barcode-based invoice generation.
- To maintain accurate records of products and transactions.
- To provide a user-friendly interface for both admin and customers.
- To develop a responsive system accessible on multiple devices.
- To ensure secure login and authentication for users.
- To improve efficiency and reduce manual errors in shop operations.

3. Environment Description:

The environment description of the Fresh Basket project explains the software tools, technologies, and hardware used for the development and execution of the system. The project

is developed as a web-based application that can run on different devices such as computers, laptops and mobile phones through a web browser.

Major Project – Fresh Basket	
Project title:	Fresh Basket
Frontend:	HTML5, CSS, React
Backend:	Node.js, Express.js
Browser and Emulator:	Chrome and Android
Platform:	VS code,
Documentation tool:	MS Word
Guided By:	Prof. Asmita Patel

4. Analysis Report:

The analysis phase of the project focuses on understanding the system requirements, identifying the problems in the existing system, and designing an improved solution. The Fresh Basket system is developed to automate the daily operations of a vegetable shop and to improve efficiency in managing stock, billing, and customer data.

4.1 Requirement Specification:

Requirement specification defines the functional and non-functional requirements needed to develop the fresh basket system.

a. Functional Requirements:

- Functional requirements describe the main features and operations that the system must perform.
- The system should allow users and administrators to register and log in securely.
- The admin should be able to add, update, delete, and manage products and stock details.
- The system should be able QR or barcode generation for billing payments.
- Customers should be able to browse products such as vegetables , salad bowls, fruit bowls, and fresh juices.
- The system should maintain customer information and ledger records.
- The system should generate profit and loss dashboards with visual charts.
- The admin should support be able to track waste items such as spoiled vegetables or damaged stock.
- The system should support customer loyalty programs where customers earn reward points for purchases.
- The application should support bulk stock upload using Excel files.
- The system should allow PDF invoice download and email sharing.

b. Non-Functional Requirements:

- Non-functional requirements describe how the system should perform.

- **Security:** The system must provide secure authentication and role-based control.
- **Performance:** The system should respond quickly to user requests.
- **Usability:** The interface should be simple and easy to use.
- **Reliability:** The system should run smoothly without data loss.
- **Compatibility:** The system should work on different browsers and devices.
- **Responsiveness:** The application should support mobile-friendly layouts and both dark and light modes.

4.2 Proposed System with its Advantages:

The Fresh Basket system is a web-based application developed to automate vegetable shop operations. It replaces manual record-keeping with a digital platform for better efficiency and accuracy.

The system includes modules such as product management, order handling, billing, and customer management.

Advantages of the Proposed System:

- **Automation of Operations:** Reduces manual work in managing stock and billing.
- **Efficient Inventory Management:** Helps maintain accurate product records.
- **Flexible Payment Options:** Supports both online payment via Razorpay and Cash on Delivery.
- **Data Management:** Stores all records digitally for easy access.
- **User-Friendly Interface:** Designed with a responsive layout for smooth usage on different devices.
- **Improved Accuracy:** Reduces human errors in calculations and record-keeping.
Note: Some advanced features like graphical dashboards are under development and can be implemented in future versions.

5. Design Report:

The design report describes the overall structure of the Fresh Basket system and how different components of the system are organized. It focuses on the layout of the website, input interfaces, and output reports generated by the system. The design phase helps in planning how users will interact with the system and how data will be processed and displayed.

The Fresh Basket application is designed as a web-based system that provides a simple, responsive, and user-friendly interface. It allows administrators to manage stock, billing, and customer records efficiently while allowing customers to browse and order products easily.

5.1 Site Diagram/ER Diagram:

The site diagram represents the structure of the website and shows how different pages of the system are connected with each other. It helps in understanding the navigation flow of the application.

The Fresh Basket system mainly consists of two sections: Admin Panel and User Interface.

5.2 Input Screen Layout:

Input screens are used to collect information from users and administrators. The design of these screens is simple and organized to ensure easy data entry.

6. Testing Report

Testing is performed to ensure that all modules of the system work correctly and efficiently. The following types of testing were conducted:

- Unit Testing: Individual components such as login, product management, and order placement were tested separately.
- Integration Testing: Combined modules were tested to ensure smooth interaction.
- System Testing: The complete system was tested as a whole.

Test Cases:

Module	Test Case	Expected Result	Actual Result	Status
Login	Valid credentials	User login success	Success	Pass
Login	Invalid credentials	Error message	Error shown	Pass
Product	Add product	Product added	Success	Pass
Order	Place order	Order created	Success	Pass
Payment	Razor Pay payment	Payment success	Success	Pass
Payment	Cash on Delivery	Order placed	Success	Pass

The testing results show that the system functions correctly and meets the required objectives.

7. Limitations of the Proposed System

Although the Fresh Basket system provides an efficient solution for managing vegetable shop operations, there are certain limitations in the current version of the system. These limitations may be improved or resolved in future updates.

Dependence on Internet Connection

Since the system is a web-based application, it requires a stable internet connection to access and manage the system. If the internet connection is slow or unavailable, the system may not function properly.

Limited AI Prediction Accuracy

The AI-based stock prediction feature may not always provide perfectly accurate results because it depends on available data and usage patterns.

Limited Payment Integration

The current system focuses mainly on billing and invoice generation and may not support full online payment gateway integration.

Basic Security Features

The system provides basic authentication and access control, but advanced security features such as multi-factor authentication and advanced encryption may not be fully implemented.

Scalability Limitations

The system is primarily designed for small vegetable shops. It may require further development to handle large-scale businesses with multiple branches.

Manual Data Entry Requirement

Some data such as product details, stock updates, and waste tracking must be entered manually, which may require additional effort from the administrator.

Limited Language Support

The system currently supports only a single language interface, which may limit accessibility for users who prefer other languages.

Device Compatibility Testing

Although the system is responsive, it may not have been fully tested on all types of devices and browsers.

Despite these limitations, the Fresh Basket system significantly improves the management of vegetable shop operations by providing digital tools for stock management, billing, and customer tracking. Future improvements can further enhance the system's performance and capabilities.

8. Future Enhancement

The Fresh Basket system has been developed to simplify the management of vegetable shop operations. However, there are several features and improvements that can be added in the future to enhance the functionality, efficiency, and user experience of the system.

Online Payment Integration

In the future, the system can integrate online payment gateways such as UPI, credit cards, and digital wallets. This will allow customers to make payments directly through the application.

Mobile Application Development

A dedicated mobile application for Android and iOS can be developed to make the system more convenient and accessible for users and administrators.

Advanced AI-Based Stock Prediction

The AI prediction feature can be improved by using advanced machine learning techniques to provide more accurate demand forecasting and reduce product shortages.

Multi-Branch Management

The system can be enhanced to support multiple shop branches, allowing owners to manage stock, sales, and employees from different locations through a single system.

Real-Time Notifications

Push notifications or SMS alerts can be added for stock updates, order confirmations, offers, and low-stock warnings.

Advanced Security Features

Future versions can include stronger security measures such as two-factor authentication, encrypted data storage, and enhanced user access control.

Multi-Language Support

The system can be expanded to support multiple languages so that users from different regions can easily use the application.

Supplier Management System

A supplier management module can be added to track vegetable suppliers, purchase orders, and delivery details.

Advanced Analytics and Reporting

More detailed reports and analytics can be included to help shop owners analyze sales trends, customer behavior, and inventory performance.

Barcode Scanner Integration

Integration with barcode scanners can further improve the billing process and make product identification faster and more accurate.

By implementing these enhancements in the future, the Fresh Basket system can become a more powerful and comprehensive solution for managing retail vegetable businesses efficiently.
